DETAILED ACTION

Claim Objections

1. Claims 4-17 & 21-24 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim should refer to other claims in the alternative only and/or cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

Examiner's Suggested Claim Drafting

The claims are currently presented do not set forth Applicant's claimed invention as clearly as possible. For that reason, it is suggested that the claims be redrafted in the following manner: A method for detecting or measuring a substance in a sample derived from a living organism comprising:

- Obtaining/preparing a sample for measurement;
- Mixing/reacting the obtained sample obtained from the living organism with a measurement reagent, producing a reaction product without producing hydrogen peroxide, having an absorption peak at a wavelength different from that of the absorption peak of the substance in an amount corresponding to that of the substance;
- Irradiating the sample for measurement with an excitation light;
- Measuring a change in physical quantity of the sample for measurement with a change in local temperature of the same, wherein the reaction product is water-soluble and the absorbance of the reaction product is in a wavelength range of the excitation light sufficient to create a temperature change.

This version of the claim is only for exemplary purposes.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 1, 2, 3, 18, 19 & 20 are rejected under 35 U.S.C. 112, second paragraph, as being incomplete for omitting essential steps, such omission amounting to a gap between the steps. See MPEP § 2172.01. The omitted steps are: a step directed to spectrometric analysis of the reaction product. Also, it appears that an additional step should be recited that correlates detecting or measuring the target analyte (substance) with the difference between the physical quantity and the temperature. How does one then arrive at the detection or concentration of the “substance” once refractive index and temperature is calculated? Further clarification is required.
